User Interface In AutoCAD, a drawing is stored in a database, where you can view, edit, modify, save and print the drawing. Each drawing is represented by an entity, and the entities are stored in a 3D database. AutoCAD uses the cursor to move, zoom and rotate through the drawing. The entire drawing can be zoomed and scrolled through at any time. In addition, you can align the cursor to a specific point and drag to move the cursor. In AutoCAD 2010 and later, you can use the Track Selection tool to move the cursor without leaving the object you are working on. The drawing window has a default user interface, which includes toolbars, palettes, guides, dimensions, text boxes and a status bar. The toolbars can be customized with additional or removed toolbars. In addition, all toolbars can be used to display information about the selected entity, as well as the drawing itself. Some more user interface options can be found here.

Save CAD data as a virtual document. Create, store and collaborate on virtual documents that can contain CAD, drawings and data. Layer Properties View: Layer Properties View brings you clarity in design by showing all settings at a glance. This view helps you easily identify and adjust the properties of individual layers. For example, when you see a layer's properties are set to Draft, you can quickly change it to Revise or Approved without ever changing the layer type. In the example above, the green checkmark indicates that the layer is a Draft, and the three white circles indicate that the layer has three properties: Visibility, Properties and Printer. The small triangle to the right of the green checkmark in the Layer Properties View lets you know which property or properties are locked to prevent changes. Locking a property prevents it from being changed from its locked position. Multiple selection of layers The new Layer Properties View shows you which settings are being used for multiple selections of layers. Show all properties on selected layers The new Layer Properties View automatically displays the properties for the selected layer. If you make changes to the layer, the properties automatically update on the other selected layers. Layer Properties View by default only displays selected layer properties, but you can now view all properties of selected layers in the View menu.
