Matiks 2009-2019 Search torrents Search files.The present invention relates to valves, and, more particularly, to in-line flow control valves. The present invention relates to a valve arrangement where the direction of fluid flow can be controlled remotely from the valve. Specifically, the present invention concerns a valve arrangement wherein a valve stem is rotatable and actuated by a position indicator which is remote from the valve, and furthermore, the present invention relates to a valve assembly arrangement wherein the valve stem is enclosed by the valve body. The present invention relates to a control valve and/or a flow control valve having a valve body, a valve stem arranged to be connected to a fluid control element, wherein a drive means is connected to the valve stem to actuate the latter through rotation and/or axial displacement of the valve stem. The drive means is connected to a position indicator which is remote from the valve, wherein the position indicator has means for changing the position of the valve stem along the valve axis by rotation thereof when a position setting is transmitted by the position indicator to the drive means. The indicator moves the valve stem through a component of movement transverse to the flow of the fluid. The control valves are used in utility, chemical and other industries to perform various functions. By way of example, the control valves can be used in pneumatic devices which operate in accordance with the fluid flow. By way of example, one such device includes a piston which is actuated in accordance with the position of the valve stem. In another use, the control valves are arranged to be used for closing off a flow section. In the industry, the control valves are connected to a fluid line by a pipe. In some applications, there is a need to be able to shut off a given portion of the fluid line for the purpose of, for example, testing of the pipe or in other similar situations. In order to achieve this, the pipe is divided into zones by special shaped valves, where the pipe or pipe line is connected to the different valves by their respective fluid conduits. In this way, the valves close off a given portion of the pipe. This approach is not satisfactory in situations where the pipe cross-section is so large that the division into different zones becomes impractical. The valves known in the industry are designed in a manner to separate the pipe into sections and thereafter connect the pipe sections to the respective flow conduits or fluid lines. In the case of large pipes, for example, for
