Q: Is a "logged" function call within a function always relevant? A friend of mine is a scientist and he keeps telling me that the time taken to run a certain process is irrelevant as long as we need a "logged" output of the runtime. I'm thinking of low level programming languages and their runtime but I'm not sure, since in that case a new instance of the program is created everytime the function is run. But in a language like Java and .Net, I don't understand how a new instance of the same program can be avoided (since there isn't a public class instance of the program, at least in .Net). If he is right, should I avoid checking if the function fails, by adding a debug print statement? A: Logs is a good source of the response times of each call. But as you mentioned the time taken is not relevant as long as the function call fails. As functions are being called in layers where one function fails the layer is not run. Same way with scenarios of a complex data-processing application. A: I think that is right! If you have a log which writes all parameters passed to the method and the time of the call, you will obtain the time taken to call the function. It is really important that it write the parameters passed to the method and also the time taken (as accurately as possible). If you are using SQL Server for instance, you should look at its print routines (sys.dm_exec_plan_attributes) and then as Aleksej said, capture the sql_handle (SqlStatementHandle) to be able to get an accurate time of each call. By the way, you should avoid using if-else and similar constructs; use a switch statement, possibly with some cases guarded with try catch blocks or something like this... (not sure how .Net works when it comes to exceptions) Of course, you

must be careful, as this "log" method must be called from the same method (as it will have the exact same parameters). Q: Can't call any validator in asp.net mvc I have a ViewModel which I'm binding to my Edit View. The Edit View has 3 fields, Email, Password, ConfirmPassword. In the ViewModel, I'm just trying to validate that Password and Conf

What's New In Adobe Photoshop Cs4 Portable Free Download Filehippo?

The present invention relates generally to a manual laundry washer and, more specifically, to a floor mounted washer with a self-powered drain pump. Manual laundry washers often require a large amount of time and power to drain the water that is used during the washing process. Manual laundry washers are often lacking in a stand-up washing capacity because a floor mounted washer cannot be tilted to a position that is substantially parallel to the surface upon which it is placed. Consequently, the amount of time and power required to drain a floor mounted washer is often excessive. Further, due to the limited space that is available on the surface upon which the washer is placed, a large sink must often be used in order to accommodate a large volume of standing water. A large sink, however, is inconvenient for daily use and difficult to clean and maintain. Attempts have been made to provide a self-powered drain pump in a laundry washer. When utilized with a floor mounted washer, a self-powered drain pump generally operates in a manner that is similar to the operation of a self-powered drain pump that is commonly utilized with upright washers. When utilized with a floor mounted washer, a self-powered drain pump often includes a drain pan that is opened when the washer is placed into a tilted position so that standing

water drains into the drain pan and is then drained from the pan. The drain pan of a self-powered drain pump, however, is often costly and difficult to install and maintain. Further, in the event that a drain pan becomes clogged, the drain pan cannot be easily emptied or replaced. Accordingly, a washer with a self-powered drain pump that drains a large volume of standing water without the use of a drain pan would be desirable. Further, a washer with a self-powered drain pump that provides a drain pan is also desirable. A self-powered drain pump assembly for a floor mounted washer is disclosed. The washer includes a water containing tank having a drain outlet that provides a path to the outside of the tank. The drain pump assembly includes a self-powered pump, a drain pan, a water containment wall, an air intake, and an air exhaust. The self-powered pump is positioned within the drain pan and water contained within the tank passes through the drain pump before passing through the drain outlet. The air intake allows air to flow into a compartment surrounding the drain pan and in the event that the drain pan becomes clogged, air is provided
