My linux. dehydrogenase 1 gene expression is associated with expression of the Brca2 tumor suppressor gene. 11beta-Hydroxysteroid dehydrogenase 1 (11HSD1) catalyzes the conversion of the active glucocorticoid to its inactive 11-keto derivative and hence plays a key role in the regulation of glucocorticoid action. The Brca2 tumor suppressor protein functions in DNA damage repair and has been implicated in the development of breast and ovarian cancers. We have recently reported that a frameshift mutation in the Brca2 gene may be associated with the development of BRCA2-associated breast cancer. To assess whether 11HSD1 might have an interaction with the Brca2 tumor suppressor gene, we cloned 11HSD1 and investigated its expression levels in a human breast cancer cell line that ectopically expresses Brca2. We observed a significant reduction in 11HSD1 expression level in Brca2-overexpressing cells compared with control cells. In addition, using a luciferase reporter assay, a significant down-regulation of 11HSD1 promoter activity was observed in the Brca2-overexpressing cells. These results indicate that 11HSD1 may have an association with Brca2.Q: Check if a list of lists is in the list of lists by using "and" [python] I have a list of lists which has a lot of sets: [['1', 'A', '2', 'B', '3'], ['1', 'A', '2', 'C', '3'], ['1', 'B', '2', 'C', '3'], ['1', 'A', '2', 'B', '4']] I also have a list of lists which is equal to the first list : [['1', 'A', '2', 'B', '3'], ['1', 'A', '2', 'C', '3'], ['1', 'B', '2', 'C

Q: Clarification needed in the definition of amenable of action Let  $\Gamma$  be a group and  $X$  a  $\Gamma$ -set; we will say that  $\Gamma$  is amenable (or  $X$  is amenable) iff there exists a  $\Gamma$ -equivariant map  $f: X \rightarrow B\Gamma$  where  $B\Gamma$  is the classifying space of  $\Gamma$ . Let  $\Gamma$  be a countable group, and  $X$  an infinite cardinal number. We say that  $\Gamma$  is amenable iff  $X$  is amenable. Both of these definitions are in a book I am studying. Both definitions are different from the definition I usually find: a group  $\Gamma$  is amenable iff  $\Gamma$  acts on some subspace  $Y$  of the Hilbert space  $\ell_2$  by continuous transformations and  $Y$  admits an invariant mean. My question is, what the difference between these two definitions of amenability? Does the usual definition imply one of those definitions? A: The first definition is using amenability of  $X$  and some compactness property for  $B\Gamma$ , whereas the second one is using the fact that if  $X$  is any infinite cardinal number then there is a  $\Gamma$ -set with  $X$  as a cardinality. The first one is usually called "amenable as a  $\Gamma$ -space" and "amenable as a measure-preserving  $\Gamma$ -space" and it is studied in the context of group cohomology. The point is that if  $\Gamma$  has a fixed point in  $X$  then the diagonal action of  $\Gamma$  on  $X \times X$  is transitive and one sees that this is exactly a measure-preserving action. The result you mention requires amenability of  $X$ . It is also possible to define amenability in this case as the existence of a diagonal action, but the compactness assumption is rather weird, and
