a specific value of the protection provided by a guaranteed annuity. This paper was published in Journal of Political Economy in 2003. He also published the first paper to investigate the optimal reinsurance structure for a company which is facing a "razor-edge" problem. Petrignani's 1984 paper demonstrated that there are real dangers in allowing insurance companies to price guaranteed annuities in a manner similar to how they handle insurance against other unforeseen events. He is a co-author of an econometric paper with Fischer Black on the pricing of equity indexed annuities which was published in the journal Journal of Financial Economics in 2003. Petrignani's most recent book, published in 2010, is entitled "The Economic Value of Guarantees: The Art and Science of Guaranteed Annuities" and is published by the Risk Books Ltd.

**What's New in the Adobe Photoshop 2022 (Version 23.1)?**

Q: Parallel parsing I have a bunch of text files. I would like to parse them using Python. I want to have two threads that each start parsing and if either of them completes, it will yield to the main thread. (I don't really need to split the work into smaller parts, but doing some preliminary work in each file before parsing is what I want to do.) So, I created two threads like this if `__name__ == '__main__':`

```
start_threads()
def start_threads():
    thread1 = Thread(target = parse, args = ('file1.txt',))
    thread2 = Thread(target = parse, args = ('file2.txt',))
    thread1.start()
    thread2.start()
And then defined the parse function and started the threads to parse the files.
import fileinput, time
filecount = 0
name = "
class Parse:
    def __init__(self, file):
        file = file.strip().split('\t')
        start_time = time.time()
        self.name = file[1]
        self.filecount = filecount
        self.file
```

---

```
= file while 1: f = fileinput.input(file = file, inplace =  
1) for line in f: if line.strip() == ": continue if  
name!= ": name = line[1] if name in name_list:
```
