One of the great things about Photoshop CS4 is that it now supports the use of the Wacom Cintiq Interactive Drawing Table. We discuss these tables in detail in Chapters 17 and 18. Adobe Photoshop is included with Photoshop Elements, and it also comes with the Adobe Creative Suite version 4. Adobe's top-level products are very expensive, so it makes sense to own both Photoshop and Photoshop Elements to avoid duplicating work. Photoshop CS5 introduced features such as Content-Aware Scaling, Content-Aware Fill, Content-Aware Move, and Content-Aware Paint. Advanced features such as these are covered later in the book. Photoshop CS6 includes even more advanced features. ## Photoshop: The Basic Features When Photoshop first came on the market, it was actually a composite program that included: * Photoshop for Mac and Photoshop for Windows * Photoshop Elements, which is a much-reduced version of Photoshop So Adobe released it as two products. In the following sections, we talk about the most important features of Photoshop, along with the Photoshop Elements version. Think of Photoshop as one of the applications that you need to run on your computer. You can run Photoshop Elements without having to install Photoshop. ## Tagging and retagging layers The layers of the file or document are the program's basic building blocks. Each layer contains one or more rectangular areas of color that contain an image (or whatever type of thing it is that you're imaging, from a photo to a 3-D model). The image in each area is actually contained in one or more layers — we discuss layers a bit more in the next section. The areas within each layer are called _areas_ and the whole layer is called a _layer_. In the Layers palette window, each layer is listed as a separate thumbnail. Retagging occurs when you select a layer and change its name. _Retagging_ is most often done to help the user remember what the layer is intended to do. See the section "Understanding the Layers Palette window" later in this chapter to find out more about the Layers palette. Figure 5-1 shows a particular retagged layer. In this case, the layers are all named "Title - X - Y - Z - About Photoshop", where X, Y, and Z are numerical values. The lower number corresponds with the image that contains the layer, so in

A: I use to do something like this: `function generateDOM(parent){ $(parent).append(""); $(parent).find('.' + $(parent).attr('class') + ").each(function(){ generateDOM($this); }); } //usage: generateDOM($('my-ancestor'));` I hope it helps A: if you want a recursive way try this: `function getRecursive(f, parent){ f.each(function(){ f =`
