I want to send an email (in PHP) from my website to a list of about 1000 email addresses. I know that I can store the list of addresses in a database so that I can retrieve them later, but that means that I need to be able to send out the message to the email addresses without being able to give the sender's email address. Is that possible? I was thinking that I might be able to get the senders' email addresses from somewhere else using PHP's mail() function, but since this is a requirement of the website, I was thinking that it might be possible to do this in a one-off query to the server so that I wouldn't have to store the addresses. A: Is it possible to retrieve a message from an SMTP server without having the sender's email address? Yes, it's possible. I do it for a company where I do not know the email addresses of the recipients. It takes some effort though. You're not going to be able to use a PHP IMAP library for this. You'll have to connect to the SMTP server using the standard PHP functions, and then do whatever it is you're going ca3bfb1094
